

Westcountry CSI Scorecard 2021

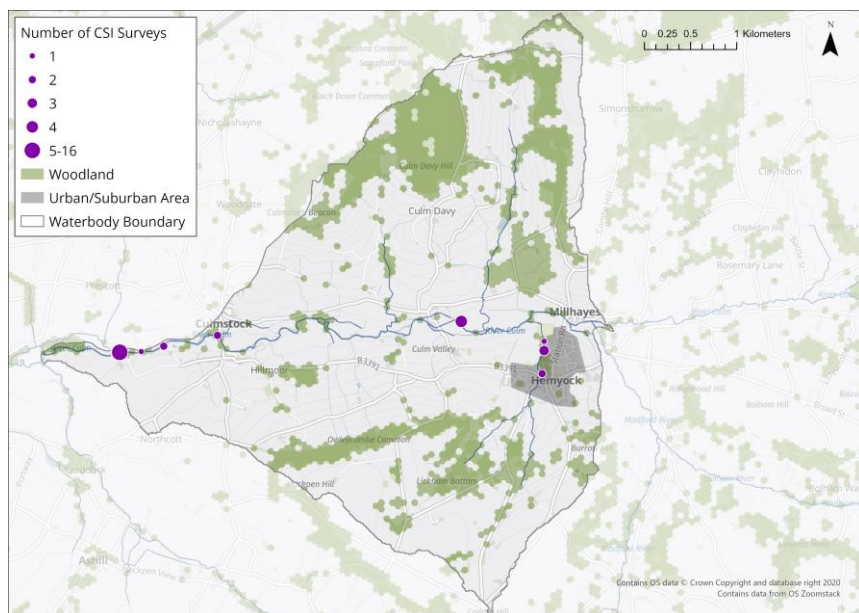

Middle Culm, East Devon

River Health Scale

A	Excellent
B	Good
C	Fair
D	Poor
E	Very Poor

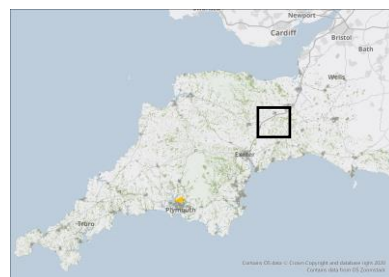

The overall score for the catchment is based on a year's data, collected at all sites in the **Middle Culm** waterbody. It is calculated from the observations and water quality results attained during a Westcountry Citizen Science Investigation (CSI) survey. A waterbody has to have at least 12 samples taken over the year for it to qualify for a scorecard.

MIDDLE CULM 2021

64%
Overall grade

DS

Dissolved Solids are measured using a handheld TDS meter. DS increase as a result of natural and anthropogenic inputs of things like chemicals, slurry, sewage or salts into the waterbody.

SS

Suspended Solids or Turbidity is measured using a turbidity tube. SS increase as a result of increased soil erosion, mine discharge and road runoff. An increase in SS reduces water clarity, making it difficult for aquatic organisms to survive.

POL

The **Pollution** score is calculated from the observations of pollution sources and evidence of recent pollution (e.g. litter or oil). These give an indication of the pollution pressures on that watercourse.

ECO

The **Ecology** score is calculated from wildlife and problem plants spotted. Wildlife spotted near a river, indicates that the river is supporting a healthy food chain. Problem plants reduce this score as they can cause issues for the biodiversity of the watercourse by shading out other plant species.

PO₄

Phosphate (PO₄) is a vital nutrient for the healthy growth of all organisms and is found in natural and artificial fertilisers, sewage and industrial wastes. Natural levels are very low and thus any measurable phosphate observed is likely due to anthropogenic influences such as misconnections, farm runoff or industrial discharge. PO₄ is measured using strips which turn blue in the presence of phosphate.

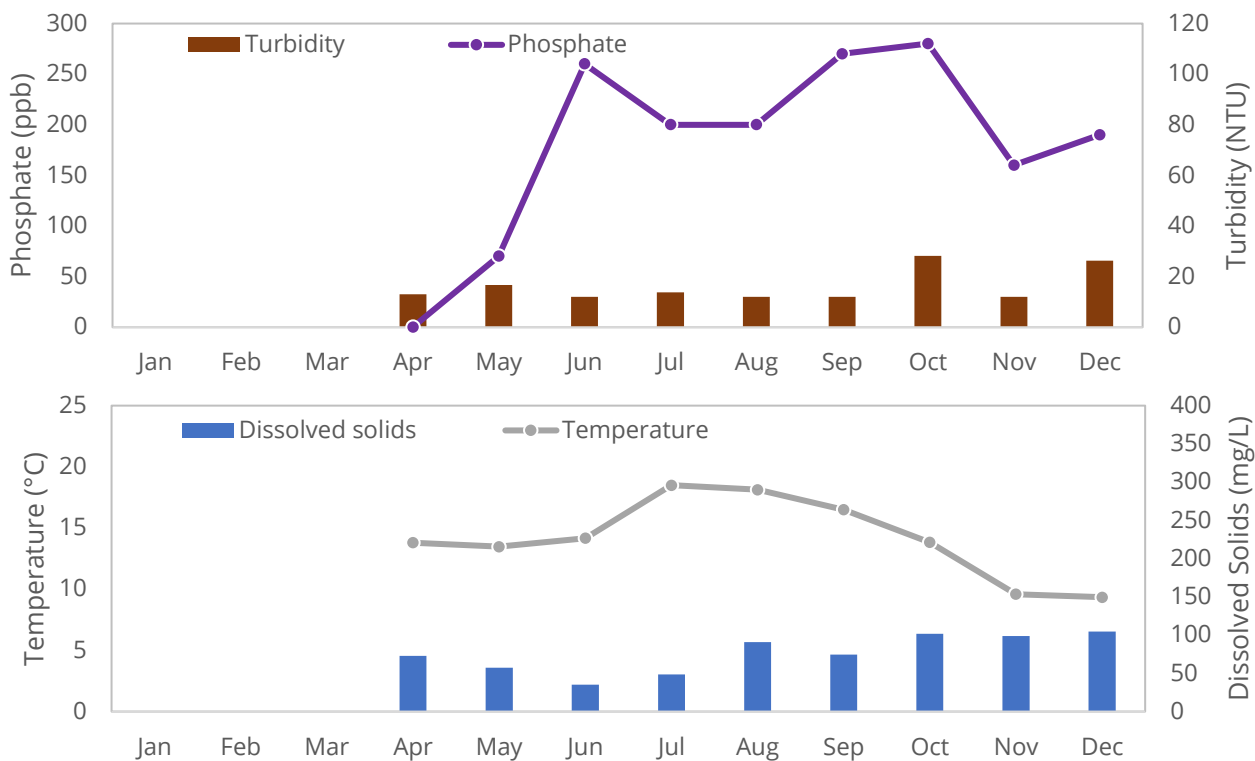

Catchment Summary

The **Middle Culm** waterbody is located in **East Devon** with its main centre of population being **Hemyock**. There are **eight** sample points and **six** active samplers in this waterbody, with **31** Westcountry CSI surveys taken in total during **2021**.

The predominant land use within 50m of these sites is, **grassland or pasture** with areas of **urban/residential, agriculture, parkland/gardens** and **woodland**. The majority bankside ecosystem is **grass** and **trees or shrubs** as well as areas of **bare earth**.

The problem plant species **Himalayan balsam** (18) has been spotted during CSI surveys of this site. **Fish** (4), **dragonflies/damselflies** (4), **dippers** (2) and **grey wagtails** (2) have all been seen in the waterbody. The predominant pollution sources come from **collapsed river banks** (13) and **cattle/stock access to the river** (10), as well as one report of **soil runoff** (1). Pollution from **foam** (6) has also been reported.

Water Quality Test Results

How to Use This Scorecard

The Westcountry CSI scorecards are produced to visualise the data collected by the volunteers across the Westcountry and to give an idea of the health of our rivers and streams. Due to the nature of the scheme, there are gaps in the data, and it should be noted that not all the sample points were sampled 12 times. Numbers in brackets in the catchment summary indicate the number of sightings of each species observed throughout the year.

Become a Westcountry Citizen Science Investigator!

Join Westcountry CSI and help to monitor a river or stream in your local area. To find out more and get in touch, visit our website: wrt.org.uk/project/become-a-citizen-scientist/ or email us at csi@wrt.org.uk.

About Westcountry Rivers Trust

The Westcountry Rivers Trust is an environmental charity (Charity no. 1135007, Company no. 06545646) established in 1995 to secure the preservation, protection, development and improvement of the rivers, streams, watercourses and water impoundments in the Westcountry and to advance the education of the public in the management of water.
